## Exploring Genetic Algorithms and Simulated AnNEALING FOR IMMOBILE LOCATION-Allocation Problem

Ferran Torrent
Víctor Muñoz
Beatriz López

## Index

## O Introduction

- Motivation
- Objectives
- The data

O The problem
O Genetic algorithms approach
O Simulated annealing approach
O Experimental results
O Conclusions and future work

## Motivation

© Model the optimization problem
© Implement GA \& SA

- Analyze GA \& SA according our data
© Compare GA and SA solutions
© Coordinates from 15578 bars from Catalunya taken from Páginas Amarillas and a maps server
© Different clusters of bars due to the impossibility to tackle the whole problem at the same time

○ Customers are randomly generated

- Number of customers: around each bar are generated between 0 and 30 customers
- Customers' coordinates: they are computed according a Gaussian distribution function centered to the corresponding bar
- Customers' match: each customer chooses a match from a list. Each match has a certain probability to be chosen

O Conclusions and future work

## Location-allocation

© Determine optimal location for one or more facilities that will service demand for a given set of points

- Every facility offers the same service
- Customers positions are known

○ Complexity: $\binom{n}{k}=\frac{n!}{k!(n-k)!}$ where $\begin{cases}n \rightarrow & \text { number of possible positions } \\ k \rightarrow & \text { number of facilities }\end{cases}$

Own Facility
Competitive Facillity

## Immobile location-allocation

© Given a set of facilities with known positions and a demand with known positions, determine the optimal service each facility has to offer
© Facilities cannot be moved and their positions are known
© Customers' positions are known
$\bigcirc$ Complexity $\rightarrow\left(N_{\text {matches }}\right)^{N_{\text {bars }}}$

## Immobile location-allocation

○ Mathematical model

$$
\max _{z_{i j}^{q}}\left\{\sum_{i=1}^{N_{\text {bars }}} \sum_{j=1}^{N_{\text {customers }}} \frac{z_{i j}^{q}}{1+d_{i j}^{2}}\right\}
$$

Subject to

$$
\begin{gathered}
\forall_{i} \sum_{j=1}^{N_{\text {customers }}} z_{i j}^{q} \leq C_{i} \\
\forall_{j} \sum_{i=1}^{N_{\text {bars }}} z_{i j}^{q} \leq 1 \\
x_{i}^{q} \neq M_{j} \rightarrow z_{i j}^{q}=0 ; \quad x_{i}^{q}, M_{j} \in\left[1, \cdots, N_{\text {matches }}\right]
\end{gathered}
$$

© State selection

$$
\begin{gathered}
P\left(s^{\prime} \mid E(s)<E\left(s^{\prime}\right)\right)=1 \\
P\left(s^{\prime} \mid E(s) \geq E\left(s^{\prime}\right)\right)=e^{\frac{E(s)-E(s)}{T}}
\end{gathered}
$$

## Neighborhood function

© Non-coordinate search space $\rightarrow$ Need of a new neighborhood function

- Each bar has a probability to change its match

- The probability varies depending the problem the algorithm's phase

## Neighborhood function

© Non-coordinate search space $\rightarrow$ Need of a new neighborhood function

- The probability changes depending on the occupation

- Different exponential curves depending on the features of the problem

## Neighborhood function comparison

| Exponential probability with variable $\tau$ |  |  | Exponential probability with $\tau=0.05$ |  |  | Variable uniform probability |  |  | Constant uniform probability |  |  |

O Introduction
O The problem
O Genetic algorithms approach
O Simulated annealing approach
O Experimental results
O Conclusions and future work

## Conclusions

- Formalization of the immobile location-allocation problem
© Implementation of GA and SA approaches
© The new neighborhood function improves the performance of SA
© SA outperforms GA
© A global optimization strategy outperforms an individual strategy

## Future work

© Develop an estimator of the customers' position just before the match
© Use the true distance between bars (considering streets) or even the temporal distance (considering different means of transport)
© Study problem partition strategies in order to simplify the given problem

- Study the use of clustering algorithms to divide the initial problem: $2^{\text {nd }}$ International Conference on Applied and Theoretical Information Systems Research (2 ${ }^{\text {nd }}$ ATISR)

## THANK YOU FOR YOUR ATTENTION

This research work has been partially funded through:

- CCIA's grant given to F. Torrent
- BRGR scholarship granted to F. Torrent
- Project DPI2011-24929
